

## “Whole House Central Water Filtration System”

The whole house water filter unit is designed as a point-of-entry system that filters water directly as it enters the home plumbing from a municipal or private well water source.

The whole house water filter provides clean, filtered water to every water source in the household.

By removing chlorine and other harmful chemicals at the point-of-entry, whole house water filters not only provide cleaner, healthier water, but better air quality, as well.

This filtration further prohibits chlorine from vaporizing in the air when used in the shower and dishwasher. Inhaling chlorine vapor is strongly correlated to the onset or aggravation of asthma and bronchitis.

Don't like drinking chlorine water?... now no longer absorb the chlorine through the skin when showering and bathing.

Whole house water filters also prevent harmful chemicals from embedding in clothing in the laundry, and they lessen the amount of detergent needed in both laundry and dishwashing.

An Eco Friendly System  
Providing Bottle Water Quality Water... To All Your Taps

## Clean, Clear Great Tasting Water for... Whole Family

No More Choline taste in your water...

No More Harmfull Metals / Drinking & Cooking

No More Plastic Bottles / Large and Small

Enviromentally Green and Re-Cycle Free

## “Whole House Central Water Softener”

There's only one way to say it: "Hard Water" has no place in your lifestyle. You can eliminate it from your home – and your life – with one of the most sophisticated water conditioning systems available today.

Unconditioned water (Hard Water) leaves its mark all over your house, resulting in a whole host of problems for homeowners, including:

- Unsightly stains and residue on sinks, tubs, tile and fixtures
- Hard water etching of glass surfaces
- Undesirable mineral build-up inside the water heater shortens its life and decreases energy efficiency\*
- Mineral build-up also negatively affects other water-using home appliances\*

Hard Water can affect you in the shower, kitchen, or anywhere else in the house, leaving you with:

- Scratchy, unabsorbent towels and premature fabric failure
- Soaps that don't lather or rinse well, leaving a residue on skin and hair
- The need to spend up to 50% more money on soaps, shampoos, detergents and other cleaning products\*\*
- Reduced effectiveness of cleaning products
- More time spent scrubbing tubs, tile and fixtures
- Higher energy costs to operate an inefficient water heater
- Shorter life cycle of water-using appliances lead to costly repairs or replacement\*
